

BUBBLE MAX AUTO-FILL NOW WITH EASY CLEAN

Now, each time you buy a Bubble Max Auto-Fill Machine, you not only get the long distance fan for throwing the bubbles over 40', but the stand to hold them in place, the ability to attach a large container (5 gal. cubitainers) for constant fluid, but you also get the "Easy Clean" mechanism for keeping the fluid from thickening.

We found from our customers, that constant use of the fluid is not sufficient enough to cause circulation for keeping the fluid fresh. Anytime the air is moving over the surface of the fluid inside the machine, it evaporates water content, leaving the fluid to get thicker and thicker.

To slow this process, we now add covers over the reservoirs to stop air circulation as well as a switch on the back of the unit to help in cleaning. We now circulate new fluid into the front, while draining the older fluid out through the overflow during the cleaning process.

When you turn the switch to "Clean", hook up warm water to the "In" tube. As the warm water flushes through the front tray, the wands are turning. We turn off the fan and the overflow switch so that we allow the overflow to push the older, thicker fluid out. By draining out the older fluid, it keeps the machine fresh and keeps the wands clean.

After 10 days of use, the wands will need cleaning. Just add warm water to the "Easy Clean" mechanism and drain out the old.
