

More Tips and Ideas for Jungle Mist Anti-Drip Systems

The Jungle-Mist Anti-Drip System is making new leads in breaking ground technology where creative minds use their abilities to imagine new ways to put water-mist to work.

LN2:

Now we are seeing lots of excitement in using the Jungle-Mist Anti-Drip System with Liquid Nitrogen effects also, where dry air needs more moisture to make LN2 appear more sensational than ever. We have found by surrounding jet nozzles with 4-6 nozzles in a 3' square (1 meter square) around the nozzle, the nozzles work together to lay a very fine mist of water around the LN2 nozzle to create a very large cloud effect every time. It's magic!

Waves of Clouds:

Because each nozzle has a shut-off valve, it makes for very exciting and dramatic effects. You can turn on all of the nozzles at once to an instant fog-mist looking like a cloud. As the cloud starts to fall, you can shut off the cloud creating a blank area instantly, all at once. Then start the cloud making process again and watch the waves of clouds move through the room. It's quite amazing.

Fog Curtain of Water-Mist:

One effects company uses the fog nozzles to generate a downward movement of air-flow from the water-mist nozzles pointed down, which draws already accumulated fog in the ceiling down with the flow of the misty cloud. This draw of fog in water-mist creates an added marbled effect that enhances the look of an already exciting 18" thick curtain. Perfect for rear projections or laser beam light shows, this highlights the event with bubbles that travel through the mist, catching the light of the rear projection or lasers that light up the entire bubble.
